

# TTK4155

## Industrial and Embedded Computer Systems Design

**NTNU – Trondheim**  
Norwegian University of  
Science and Technology

### Lab lecture 7

- I2C bus
- Motor controller box
- Solenoid

## Exercise 7: Controlling motor and solenoid

- In this exercise, you will
  - Connect the motor controller box to STK500 and I/O board
  - Connect the ping pong board to the motor controller box
  - Use Atmel's I2C driver to control the DAC on the I/O board
  - Create a motor control driver and test with joystick input
  - Create a speed and/or position controller using feedback from the quadrature encoder
  - Connect the solenoid and use a button on the joystick to fire

# Motor box interface

# Motor box interface

- Simple control pin interface

## MJ1

GND	IRST	EN		
2	4	6	8	10
1	3	5	7	9

IOE	SEL	DIR		
-----	-----	-----	--	--

## MJ2

GND	DO1	DO3	DO5	DO7
2	4	6	8	10
1	3	5	7	9

DO0	DO2	DO4	DO6	
-----	-----	-----	-----	--

## MJEX

GND							
2	4	6	8	10	12	14	16
1	3	5	7	9	11	13	15

DA1							
-----	--	--	--	--	--	--	--

- Connect motor to M+ and M-
- Connect encoder to “Encoder input”

# Basic control of motor

- Set motor “speed” by adjusting DAC voltage
- Select direction with DIR pin
- Set EN pin high to enable motor

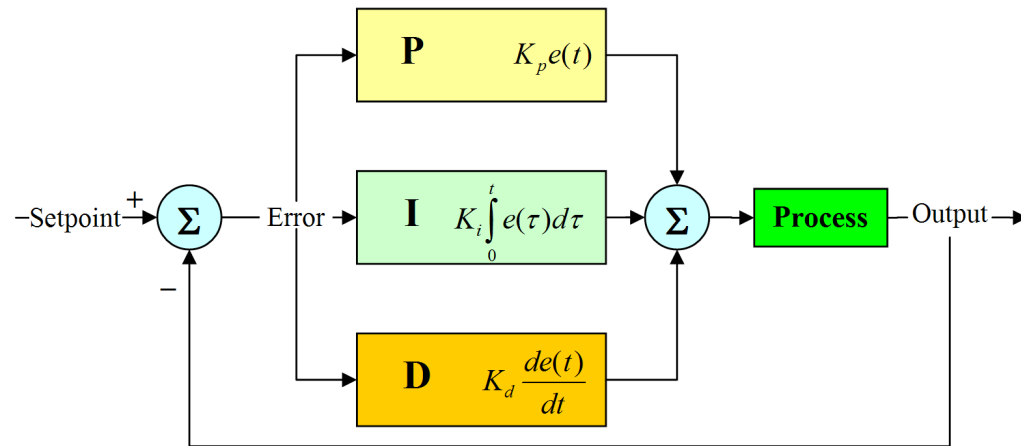

# Read motor encoder

- Internal 16 bits counter
- !OE pin activates output of encoder counter
- SEL selects either high byte (0) or low byte (1)
- !RST resets the counter

# Position regulator

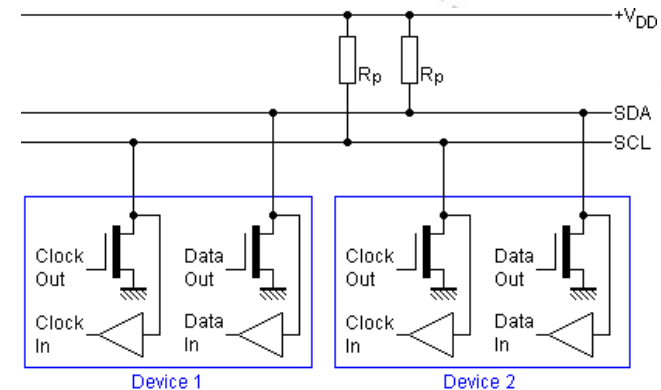

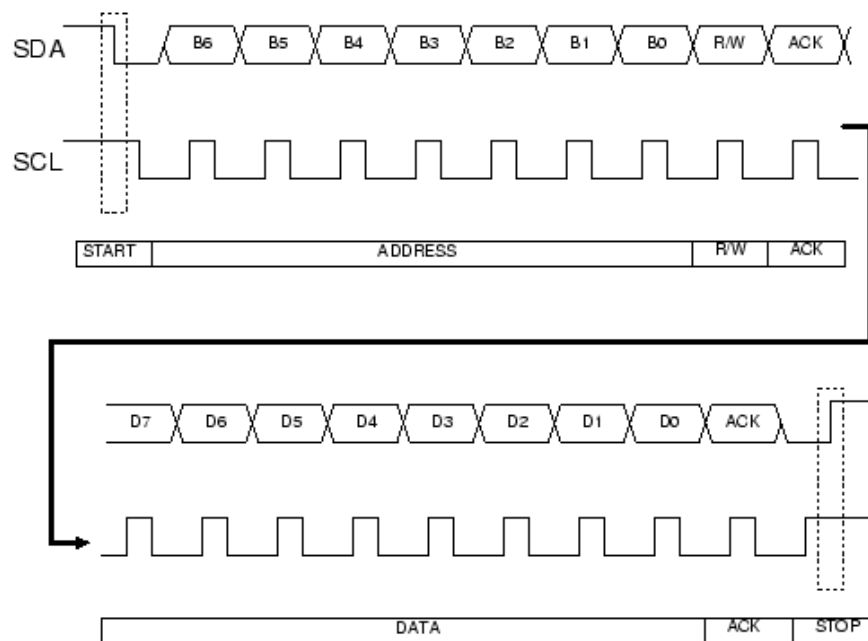

- For example a PID regulator

- The quadrature encoder will give an indication of the motor position
- The error is the difference between the indicated position and the wanted position (from the joystick)
- Calculate the necessary values P, I and D
- Sum all values and apply to motor

# DAC interface

- Use I2C to interface with the DAC
- I2C is a two-wire protocol, clock line and bi-directional data line
- Master/slave configuration
- Fairly simple protocol:

# Atmel I2C driver

- To make things simple you can download the I2C driver provided by Atmel: [http://www.atmel.com/dyn/resources/prod\\_documents/AVR315.zip](http://www.atmel.com/dyn/resources/prod_documents/AVR315.zip)
- This driver is written for a different compiler (IAR), so some changes have to be done:
  - `#include "ioavr.h"` → `#include <avr/io.h>`
  - `#include "inavr.h"` → `#include <avr/interrupt.h>`
  - `#pragma vector=TWI_vect`
  - `__interrupt void TWI_ISR(void)` → `ISR(TWI_vect)`
  - `__enable_interrupt();` → `sei();`
- To use the driver you must
  - Include the twi file
  - Initialize TWI module and enable interrupts
  - Use `TWI_Start_Transceiver_With_Data(unsigned char *msg, unsigned char msgSize)`
- Also read the appnote: [http://www.atmel.com/dyn/resources/prod\\_documents/doc2564.pdf](http://www.atmel.com/dyn/resources/prod_documents/doc2564.pdf)

# Using the MAX520 DAC

- Pretty straight forward. Read the data sheet

Figure 4. All communications begin with a START condition and end with a STOP condition, both generated by a bus master.

Figure 5. Address Byte

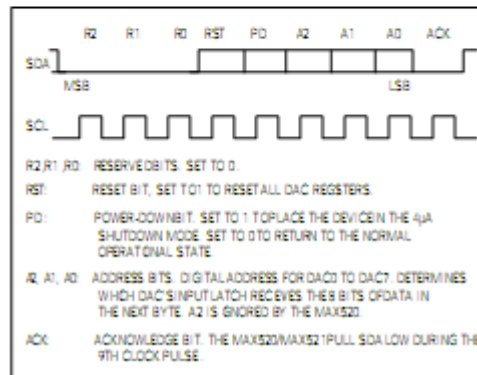

Figure 6. Command Byte

# Solenoid

- The solenoid requires 12V (at least) to throw a punch
- A relay have to be used
- But the AVR I/O pins can not supply the necessary current to drive the relay
- A transistor is used
- Protective diode at the relay input

# Questions?

**NTNU – Trondheim**
